

# Biodynamics

Biodynamic cultivation is a production philosophy based on respect for the balance of nature and inspired by the principles identified by Rudolf Steiner.

All organisms are an integral part of the universe.

Working in harmony with the rhythms, cycles and forces of nature, the vine grower can improve the **fertility of the soil**, the **vitality of the plants** and the **quality of the grapes**.

“It is the intrinsic quality of the produce, the forces contained within them, that enable men to think sanely.

It is the man of the soil who, by shaping the landscape harmoniously, provides of a framework for life that is satisfying to the thoughts of men.”

Jacques Mell
